Hotel Georgia Slab Strengthening

Floor slabs at Hotel Georgia had existing openings on ten floors which had been filled with concrete. There were also new openings to be cut into the existing slab. All of these locations required additional flexural enhancement.

Fibrwrap installed Fyfe Company's unidirectional Tyfo® SCH-41 system to supplement the required flexural enhancement, as depicted by Glotman Simpson Consulting Engineers.

Implementing new-age technology, the owner was provided an alternative to conventional construction, which resulted in vast time savings, lower remedial costs and reduced shut down time.
